

SH14 can support of varying thickness upto 5" and 12" deep. A 12" deep shelf mounted on two brackets can support evenly distributed loads up to 50 lbs per shelf. (Must be intalled into Studs)

STEP BY STEP INSTALLATION

1. Each bracket consists of a top and bottom piece. The bottom piece comes with clear plastic shelf rests that cushion the shelves and keep them from sliding (included on bottom piece only). Insert both pieces of SH14 into the track and tighten the bottom bracket at the desired location by tightening the set screw. Top bracket will rest on top of bottom bracket and slide up and down freely.

NOTE: SH14 must be installed into the top or bottom ends of the standards or poles. For floor to ceiling application, brackets should be inserted before the standard is screwed to the wall.

2. Ensure bottom brackets are level, adjusting them as needed.

Make sure the set screw is securely tightened. **DO NOT OVERTIGHTEN.**

3. Slide the top brackets up and insert the shelf atop the bottom brackets.

Slide top brackets firmly onto the shelf and secure with set screws.

Make sure all set screws are secure and that the shelf is clamped firmly in place.

NOTE: Tracks must be installed into studs to support evenly
